# The colortbl package\*

# David Carlisle 2022/06/20

### Abstract

This package implements a flexible mechanism for giving coloured 'panels' behind specified columns in a table. This package requires the array and color packages.

### 1 Introduction

This package is for colouring tables (i.e., giving coloured panels behind column entries). In that it has many similarities with Timothy Van Zandt's colortab package. The internal implementation is quite different though, also colortab works with the table constructs of other formats besides LATEX. This package requires LATEX (and its color and array packages).

First, a standard tabular, for comparison.

```
begin{tabular}{|1|c|}
one&two\\
three&four
\end{tabular}
one two
three four
\end{tabular}
```

### 2 The \columncolor command

The examples below demonstrate various possibilities of the \columncolor command introduced by this package. The vertical rules specified by | are kept in all the examples, to make the column positioning clearer, although possibly you would not want coloured panels and vertical rules in practice.

The package supplies a \columncolor command, that should (only) be used in the argument of a > column specifier, to add a coloured panel behind the specified column. It can be used in the main 'preamble' argument of array or tabular, and also in \multicolumn specifiers.

The basic format is:

 $\columncolor[\langle color\ model \rangle] \{\langle colour \rangle\} \ [\langle left\ overhang \rangle] \ [\langle right\ overhang \rangle]$ 

The first argument (or first two if the optional argument is used) are standard color package arguments, as used by \color.

The last two arguments control how far the panel overlaps past the widest entry in the column. If the *right overhang* argument is omitted then it defaults to *left overhang*. If they are both omitted they default to **\tabcolsep** (in tabular) or **\arraycolsep** (in array).

If the overhangs are both set to Opt then the effect is:

<sup>\*</sup>This file has version number v1.0f, last revised 2022/06/20.

```
|>{\columncolor[gray]{.8}[0pt]}1|
>{\color{white}%
  \columncolor[gray]{.2}[0pt]}1|
```

The default overhang of \tabcolsep produces:

```
|>{\columncolor[gray]{.8}}1|
>{\color{white}%
  \columncolor[gray]{.2}}1|
```

You might want something between these two extremes. A value of .5 $\$ tabcolsep produces the following effect

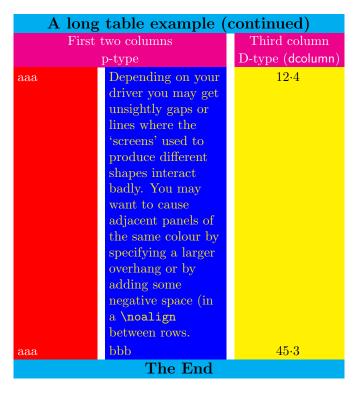

```
|>{\columncolor[gray]{.8}[.5\tabcolsep]}1|
>{\color{white}%
  \columncolor[gray]{.2}[.5\tabcolsep]}1|
```

This package should work with most other packages that are compatible with the array package syntax. In particular it works with longtable and dcolumn as the following example shows.

Before starting give a little space: \setlength\minrowclearance{2pt}

A long table example						
First two columns		Third column				
$\operatorname{p-type}$		D-type (dcolumn)				
P-column	and another one	12.34				
Total	(wrong)	100.6				
Some long	bbb	1.2				
text in the						
first column						
aaa	and some long text	1.345				
	in the second					
	column					
Total	(wrong)	100.6				
aaa	bbb	1.345				
Note that	bbb	1.345				
the coloured						
rules in all						
columns						
stretch to						
accomodate						
large entries						
in one						
column.						
aaa	bbb	100				
$\operatorname{Continued}$						

This example shows rather poor taste but is quite colourful! Inspect the source file, colortbl.dtx, to see the full code for the example, but it uses the following column types.

```
\newcolumntype{A}{%
   >{\color{white}\columncolor{red}[.5\tabcolsep]%
      \raggedright}%
  p{2cm}}
\newcolumntype{B}{%
   >{\columncolor{blue}[.5\tabcolsep]%
     \color{yellow}\raggedright}
  p{3cm}}
\newcolumntype{C}{%
    >{\columncolor{yellow}[.5\tabcolsep]}%
      D{.}{\cdot}{3.3}}
\newcolumntype{E}{%
   >{\large\bfseries
     \columncolor{cyan}[.5\tabcolsep]}c}
\newcolumntype{F}{%
    >{\color{white}
      \columncolor{magenta}[.5\tabcolsep]}c}
\newcolumntype{G}{%
    >{\columncolor[gray]{0.8}[.5\tabcolsep][\tabcolsep]}1}
\newcolumntype{H}{>{\columncolor[gray]{0.8}}1}
\newcolumntype{I}{%
    >{\columncolor[gray]{0.8}[\tabcolsep][.5\tabcolsep]}%
                   D{.}{\cdot}{3.3}}
```

# 3 Using the 'overhang' arguments for tabular\*

The above is all very well for tabular, but what about tabular\*?

Here the problem is rather harder. Although TEX's \leader mechanism which is used by this package to insert the 'stretchy' coloured panels is rather like glue, the \tabskip glue that is inserted between columns of tabular\* (and longtable for that matter) has to be 'real glue' and not 'leaders'.

Within limits the overhang options may be used here. Consider the first table example above. If we use tabular\* set to 3 cm with a preamble setting of

```
\begin{tabular*}{3cm}{%
@{\extracolsep{\fill}}
>{\columncolor[gray]{.8}[0pt][20mm]}1
>{\columncolor[gray]{.8}[5mm][0pt]}1

a{\frac{1}{20mm}}
one two
three four
```

Changing the specified width to  $4\,\mathrm{cm}$  works, but don't push your luck to  $5\,\mathrm{cm}\dots$ 

one	$\mathbf{two}$	one	two
three	four	${f three}$	four

### 4 The \rowcolor command

As demonstrated above, one may change the colour of specified rows of a table by the use of \multicolumn commands in each entry of the row. However if your table is to be marked principally by *rows*, you may find this rather inconvenient. For this reason a new mechanism, \rowcolor, has been introduced<sup>1</sup>.

\rowcolor takes the same argument forms as \columncolor. It must be used at the *start* of a row. If the optional overhang arguments are not used the overhangs will default to the overhangs specified in any \columncolor comands for that column, or \tabcolsep (\arraycolsep in array).

If a table entry is in the scope of a \columncolor specified in the table preamble, and also a \rowcolor at the start of the current row, the colour specified by \rowcolor will take effect. A \multicolumn command may contain >{\rowcolor... which will override the default colours for both the current row and column.

### 5 The \rowcolors command

The \rowcolors command and its documentation originate in the xcolor package by Dr. Uwe Kern.

```
\label{localize} $$\operatorname{[\langle commands\rangle]}_{\langle row\rangle}_{\langle odd\text{-}row\ color\rangle}_{\langle even\text{-}row\ color\rangle}_{\langle even\text
```

<sup>&</sup>lt;sup>1</sup>At some cost to the internal complexity of this package

One of these commands has to be executed before a table starts.  $\langle row \rangle$  tells the number of the first row which should be colored according to the  $\langle odd$ -row color  $\rangle$ and  $\langle even-row\ color \rangle$  scheme. Each of the color arguments may also be left empty (= no color). In the starred version,  $\langle commands \rangle$  are ignored in rows with inactive rowcolors status (see below), whereas in the non-starred version,  $\langle commands \rangle$  are applied to every row of the table. Such optional commands may be \hline or  $\noalign{\langle stuff \rangle}.$ 

\showrowcolors

The rowcolors status is activated (i.e., use coloring scheme) by default and/or \hiderowcolors \showrowcolors, it is inactivated (i.e., ignore coloring scheme) by the command \rownum \hiderowcolors. The counter \rownum (or LATEX counter rownum) may be used within such a table to access the current row number.

> At the present time, the rownum counter is only incremented in tables using \rowcolors.

```
\rowcolors[\hline]{3}{green}{yellow} \arrayrulecolor{red}
\begin{tabular}{11}
test & row \therownum\\
test & row \therownum\\
                                          test
                                                row 1
                                                                      row 1
                                                                test
test & row \therownum\\
                                          test
                                                row 2
                                                                test
                                                                      row 2
test & row \therownum\\
                                          test
                                                 row 3
                                                                       row 3
\arrayrulecolor{black}
                                                row 4
test & row \therownum\\
                                          test
                                                                test
                                                                      row 4
test & row \therownum\\
                                          test
                                                 row 5
                                                                       row 5
\rowcolor{blue}
                                                row 6
                                          test
                                                                      row 6
test & row \therownum\\
                                                 row 7
test & row \therownum\\
                                          test
                                                row 8
                                                                       row 8
\hiderowcolors
                                          test
                                                row 9
                                                                test
                                                                      row 9
test & row \therownum\\
                                                row 10
                                                                test
                                                                      row 10
                                          test
test & row \therownum\\
                                                                       row 11
                                          test
                                                                test
                                                 row 11
\showrowcolors
                                                                      row 12
                                                                test
test & row \therownum\\
                                          test
                                                row 12
test & row \therownum\\
                                          test
                                                 row 13
                                                                test
                                                                       row 13
\multicolumn{1}%
 {>{\columncolor{red}}}1}{test} & row \therownum\\
\end{tabular}
```

#### 6 The \cellcolor command

A background colour can be applied to a single cell of a table by beginning it with \multicolumn{1}{>{\rowcolor..., (or \columncolor if no row-colour is in effect) but this has some deficiencies: 1) It prevents data within the cell from triggering the colouration; 2) The alignment specification must be copied from the top of the tabular, which is prone to errors, especially for p{} columns; 3) \multicolumn{1} is just silly. Therefore, there is the \cellcolor command, which works like \columncolor and \rowcolor, but over-rides both of them; \cellcolor can be placed anywhere in the tabular cell to which it applies.

# Colouring rules.

So you want coloured rules as well?

One could do vertical rules without any special commands, just use something like !{ $\color{green}\vline}$  where you'd normally use |. The space between || will normally be left white. If you want to colour that as well, either increase the overhang of the previous column (to  $\tolor{color}$  +  $\tolor{color}$  +  $\tolor{color}$  or remove the inter rule glue, and replace by a coloured rule of the required thickness. So

```
!{\color{green}\vline}
@{\color{yellow}\vrule width \doublerulesep}
!{\color{green}\vline}
```

Should give the same spacing as || but more colour.

However colouring \hline and \cline is a bit more tricky, so extra commands are provided (which then apply to vertical rules as well).

### 8 \arrayrulecolor

\arrayrulecolor takes the same arguments as \color, and is a global declaration which affects all following horizontal and vertical rules in tables. It may be given outside any table, or at the start of a row, or in a > specification in a table preamble. You should note however that if given mid-table it only affects rules that are specified after this point, any vertical rules specified in the preamble will keep their original colours.

# 9 \doublerulesepcolor

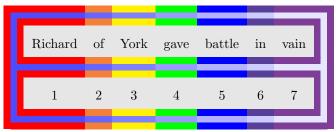

Having coloured your rules, you'll probably want something other than white to go in the gaps made by || or \hline\hline. \doublerulesepcolor works just the same way as \arrayrulecolor. The main thing to note that if this command is used, then longtable will not 'discard' the space between \hline\hline at a page break. (TeX has a built-in ability to discard space, but the coloured 'space' which is used once \doublerulesep is in effect is really a third rule of a different colour to the two outer rules, and rules are rather harder to discard.)

```
\setlength\arrayrulewidth{2pt}\arrayrulecolor{blue}
\setlength\doublerulesep{2pt}\doublerulesepcolor{yellow}
\begin{tabular}{||1||c||}
\hline\hline
one&two\\
three&four\\
\hline\hline
\end{tabular}
```

### 10 More fun with \hhline

The above commands work with \hhline from the hhline package, however if hhline is loaded in addition to this package, a new possibility is added. You may use >{...} to add declarations that apply to the following - or = column rule. In particular you may give \arrayrulecolor and \doublerulesepcolor declarations in this argument.

Most manuals of style warn against over use of rules in tables. I hate to think what they would make of the following rainbow example:

```
\newcommand\rainbowline[1]{%
\hhline{%
       >{\arrayrulecolor
                                                                          {red}\doublerulesepcolor[rgb]{.3,.3,1}}%
       |#1:=%
       >{\arrayrulecolor{orange}\doublerulesepcolor[rgb]{.4,.4,1}}%
      >{\arrayrulecolor{yellow}\doublerulesepcolor[rgb]{.5,.5,1}}%
       =%
       >{\arrayrulecolor {green}\doublerulesepcolor[rgb]{.6,.6,1}}%
       >{\arrayrulecolor {blue}\doublerulesepcolor[rgb]{.7,.7,1}}%
       =%
       >{\arrayrulecolor{indigo}\doublerulesepcolor[rgb]{.8,.8,1}}%
       >{\arrayrulecolor{violet}\doublerulesepcolor[rgb]{.9,.9,1}}%
       =:#1|%
      }}
\arrayrulecolor{red}
\doublerulesepcolor[rgb]{.3,.3,1}%
\begin{tabular}{||*7{>{\columncolor[gray]{.9}}c}||}
\r \{t\}
\arrayrulecolor{violet}\doublerulesepcolor[rgb]{.9,.9,1}
Richard&of&York&gave&battle&in&
\model{linear} \model{linear} $$\model{linear} \c|\model{linear} \c|\model{linear} \c|\model{linear} \c|\model{linear} $$\model{linear} $$\m
\rainbowline{}%
1&2&3&4&5&6&
\model{likelihood} \mathbf{1}{>{\columncolor[gray]{.9}}c||}{7}\
\rainbowline{b}%
```

### 11 Less fun with \cline

\end{tabular}

Lines produced by \cline are coloured if you use \arrayrulecolor but you may not notice as they are covered up by any colour pannels in the following row. This is a 'feature' of \cline. If using this package you would probably better using the - rule type in a \hhline argument, rather than \cline.

### 12 The \minrowclearance command

As this package has to box and measure every entry to figure out how wide to make the rules, I thought I may as well add the following feature. 'Large' entries in tables may touch a preceding \hline or the top of a colour panel defined by this style. It is best to increase \extrarowsep or \arraystretch sufficiently to ensure this doesn't happen, as that will keep the line spacing in the table regular. Sometimes however, you just want to LATEX to insert a bit of extra space above a large entry. You can set the length \minrowclearance to a small value. (The height of a capital letter plus this value should not be greater than the normal height of table rows, else a very uneven table spacing will result.)

Donald Arseneau's tabls packages provides a similar \tablinesep. I was going to give this the same name for compatibility with tabls, but that is implemented quite differently and probably has different behaviour. So I'll keep a new name for now.

### 13 The Code

```
1 \langle *package \rangle
```

Nasty hacky way used by all the graphics packages to include debugging code.

- 2 \edef\@tempa{%
- 3 \noexpand\AtEndOfPackage{%
- 4 \catcode'\noexpand\^^A\the\catcode'\^^A\relax}}
- 5 \@tempa
- 6 \catcode'\^^A=\catcode'\%
- 7 \DeclareOption{debugshow}{\catcode'\^^A=9 }

All the other options are handled by the color package.

- 8 \DeclareOption\*{\PassOptionsToPackage\CurrentOption{color}}
- 9 \ProcessOptions

I need these so load them now. Actually Mark Wooding's mdwtab package could probably work instead of array, but currently I assume array package internals so

10 \RequirePackage{array,color}

\@classz First define stub for new array package code.

11 \ifx\do@row@strut\@undefined\let\do@row@strut\relax\fi

\@classz is the main function in the array package handling of primitive column types: It inserts the code for each of the column specifiers, 'clrpmb'. The other classes deal with the other preamble tokens such as '@ 'or '>'.

- 12 \def\@classz{\@classx
- 13 \@tempcnta \count@
- 14 \prepnext@tok

At this point the colour specification for the background panel will be in the code for the '>' specification of this column. This is saved in \toks\@temptokena but array will insert it too late (well it would work for c, but not for p) so fish the colour stuff out of that token register by hand, and then insert it around the entry.

Of course this is a terrible hack. What is really needed is a new column type that inserts stuff in the right place (rather like! but without the spacing that that does). The \newcolumntype command of array only adds 'second class'

column types. The re-implementations of \newcolumntype in my blkarray or Mark Wooding's mdwtab allow new 'first class' column types to be declared, but stick with array for now. This means we have to lift the stuff out of the register before the register gets emptied in the wrong place.

15 \expandafter\CT@extract\the\toks\@tempcnta\columncolor!\@nil

Save the entry into a box (using a double group for colour safety as usual).

16 \@addtopreamble{%
17 \setbox\z@\hbox\bgroup\bgroup
18 \CT@everycr{}%
19 \ifcase \@chnum

c code: This used to use twice as much glue as 1 and r (1fil on each side). Now modify it to use 1fill total. Also increase the order from 1fil to 1fill to dissuade people from putting stretch glue in table entries.

```
20 \hskip\stretch{.5}\kern\z@
21 \d@llarbegin
22 \insert@column
23 \d@llarend\do@row@strut\hskip\stretch{.5}\or
```

1 and r as before, but using fill glue.

```
\d@llarbegin \insert@column \d@llarend\do@row@strut \hfill \or
\hfill\kern\z@ \d@llarbegin \insert@column \d@llarend\do@row@strut \or
```

m, p and b as before, but need to take account of array package update.

```
26
        \ifx\ar@align@mcell\@undefined
27
          $\vcenter
28
           \@startpbox{\@nextchar}\insert@column \@endpbox $
29
        \else
30
          \setbox\ar@mcellbox\vbox
            \@startpbox{\@nextchar}\insert@column \@endpbox
31
          \ar@align@mcell
32
          \do@row@strut
33
        \fi
34
     \or
35
     \vtop \@startpbox{\@nextchar}\insert@column \@endpbox\do@row@strut \or
36
     \vbox \@startpbox{\@nextchar}\insert@column \@endpbox\do@row@strut
37
```

Close the box register assignment.

39 \egroup\egroup

The main new stuff.

40 \begingroup

Initalise colour command and overhands.

41 \CT@setup

Run any code resulting from \columncolor commands.

42 \CT@column@color

Run code from \rowcolor (so this takes precedence over \columncolor).

43 \CT@row@color

Run code from \cellcolor (so this takes precedence over both \columncolor and \rowcolor).

44 \CT@cell@color

This is \relax unless one of the three previous commands has requested a colour, in which case it will be \CT@@do@color which will insert \leaders of appropriate colour.

```
45 \CT@do@color
46 \endgroup
```

Nothing to do with colour this bit, since we are boxing and measuring the entry anyway may as well check the height, so that large entries don't bump into horizontal rules (or the top of the colour panels).

```
47 \Qtempdima\ht\zQ
48 \advance\Qtempdima\minrowclearance
49 \vrule\Qheight\Qtempdima\Qwidth\zQ
```

It would be safer to leave this boxed, but unboxing allows some flexibilty. However the total glue stretch should either be finite or fil (which will be ignored). There may be fill glue (which will not be ignored) but it should total Ofill. If this box contributes fill glue, then the leaders will not reach the full width of the entry. In the case of \multicolumn entries it is actually possible for this box to contribute shrink glue, in which case the coloured panel for that entry will be too wide. Tough luck.

```
50 \unhbox\z@}%
51 \prepnext@tok}
```

**\CT@setup** Initialise the overhang lengths and the colour command.

```
52 \def\CT@setup{%
53 \@tempdimb\col@sep
54 \@tempdimc\col@sep
55 \def\CT@color{%
56 \global\let\CT@do@color\CT@@do@color
57 \color}}
```

\CT@@do@color The main point of the package: Add the colour panels.

Add a leader of the specified colour, with natural width the width of the entry plus the specified overhangs and 1 fill stretch. Surround by negative kerns so total natural width is not affected by overhang.

```
58 \def\CT@do@color{%
59 \global\let\CT@do@color\relax
60 \@tempdima\wd\z@
61 \advance\@tempdima\@tempdimb
62 \advance\@tempdima\@tempdimc
63 \kern-\@tempdimb
64 \leaders\vrule
```

For quick debugging with xdvi (which can't do colours). Limit the size of the rule, so I can see the text as well.

```
65 ^A \@height\p@\@depth\p@
66 \hskip\@tempdima\@plus 1fill
67 \kern-\@tempdimc

Now glue to exactly compensate for the leaders.
68 \hskip-\wd\z@ \@plus -1fill }
```

```
\CT@extract Now the code to extract the \columncolor commands.
              69 \def\CT@extract#1\columncolor#2#3\@ni1{%
              70 \if!\noexpand#2%

 \rowcolors [\langle commands \rangle] \{\langle row \rangle\} \{\langle odd\text{-}row \ color \rangle\} \{\langle even\text{-}row \ color \rangle\}\}
\rowcolors* Defines alternating colors for the next tabular environment. Starting with row
             \langle row \rangle, odd and even rows get their respective colors. The color arguments
             may also be left empty (= no color). Optional commands may be hline or
             noalign{\langle stuff \rangle}.
                 In the starred version, \langle commands \rangle are ignored in rows with inactive rowcolors
             status (see below), whereas in the non-starred version, (commands) are applied to
             every row of the table.
